Please use the following guidelines when using the solvent cans.

⇒ The cans are intended for solvent-type wastes.

◊ Acidic or caustic materials should NOT be placed in the cans, unless the mixture has a pH between 5 and 10 before it is placed into the solvent can.

⇒ All of the cans are equipped with stay-open lids, but lids should only be locked open when actively adding waste.

⇒ Please use the proper can for the solvents you are using.

◊ Halogenated cans are marked with a “Halogenated Solvent Waste” label. Non-Halogenated cans are marked with a “Non-Halogenated Solvent Waste” label.

⇒ DO NOT write directly on the waste container. If there is something unusual about the waste, note it on the waste accumulation label, or attach a separate note to the container.

---

**DO NOT OVERFILL THE RED CANS! KEEP LIQUID LEVEL BELOW THE FLASH ARRESTOR**

- The liquid level must not be visible above the bottom of the flash arrestor (the perforated steel basket in the mouth of the can).

- The flash arrestor is not a strainer. All solids must be removed before adding waste to the can.
